

TOPOTYPE geometry identifier Node<2U> ::BREP_entity_;

Created to classify finite element mesh nodes in terms of the role they have in supporting the boundary representation of the original geomodel.

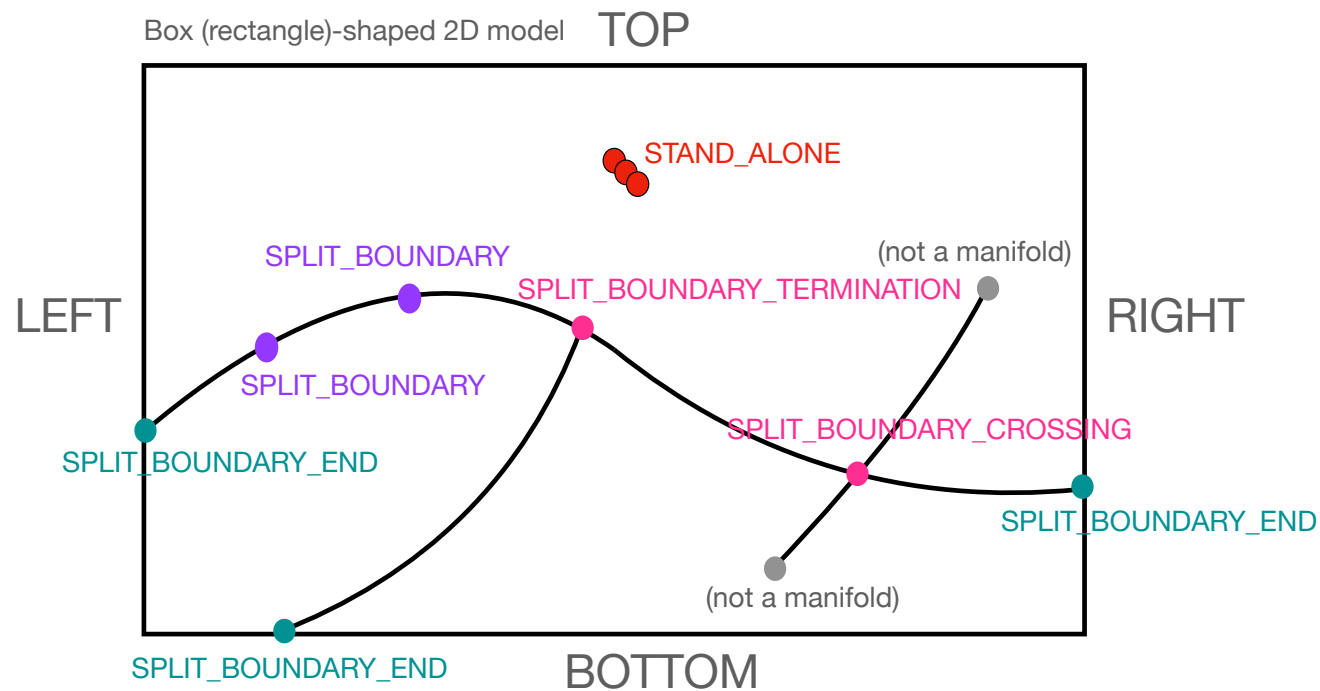

TOPOTYPE geometry identifier Node<3U>::BREP_entity_;

Classification of NodeManifold<2U> objects along SplitBoundary in terms of enum ManifoldType

End points of split boundaries terminating within a model are not node manifolds because the Nodes at these points are not duplicated.
By contrast, SplitBoundary terminations on the perimeter of a Model have multiplied nodes.

Since the end points of free-standing SplitBoundaries are not manifolds, they cannot be labelled as such.

NodeManifold enum **ManifoldType** classifiers used to distinguish topologically collocated Nodes within a model.

Classification of NodeManifold<3U> objects along SplitBoundary in terms of enum ManifoldType
